Step1)

First I converted the number into a string. To be able to do indexing

I splitted the string from zeroes, into different segments.

I have a list of strings without zeroes

Step 2)

Loop over this list and if segments lenght was greater than 13, I calculate the first 13 digits procuct. Declare and set product variable to be 1. Then save the 13 digit product in this variable.

Then compare product and greatest_product variable

If product variable is greater then greatest_product variable. Set greatest_variable to be product var

Step 3)

Then i enter another loop inside the segment.

Multiply the 14th digit with product and divide by 1st digit.

New product gets set old product multiplied by the right new digit and divided by old digit, this allows to calculate the next 13 length windows product.

For example

$$\underbrace{1\ 2\ 3\ 4\ 5\ 6\ 7\ 8\ 9\ 10\ 11\ 12\ 13}_{\text{Product}}\ 14$$

If product is $\underbrace{1\times 2\times 3\times 4\times 5\times 6\times 7\times 8\times 9\times 10\times 11\times 12\times 13}_{\text{product}}$

then next sequence is product $\times \frac{14}{1}$.

Then check again if new product is greater than old one. Same as before.

Then this loop will continue till the end of the segment.

Then move onto another segment from Step 2

Product variable will be set 1 and the next segments first 13th digit product will be calculated.
