Step 1)

Import the data from .txt file using python's built in f/o library. Line by line save data into a matrix and convert numbers into integer
End result is a Matrix containing lists of lines where numbers stored as integers.

e.g [15],
[67, 34]]

Step 2)

Iterate over this matrix in reverse, starting from second last row.
In each row. Iterate over its numbers from left and check the paths you can take below.
Add the bigger of them to our original number and move one step right e.g

2
Start → 10 4
7 3 8
check 1 check 2

7 > 3 so add 7 to 10
8 > 3 add 8 to 4

Now Matrix looks like

2
17 12

Some operation add 17 to 2 and find max sum to be 19

Step 3)

Go up a row and do step 2 with updated last row. At the end of for loop the top element of the matrix would be updated as the max sum.
